DETAILED ACTION

Response

1. This Office Action is in response to Applicants' arguments filed December 6, 2006. Applicants pointed out that the reference used in the previous rejection of November 15, 2006 did not have a valid priority date. The rejection is withdrawn. Claims 1-5 are pending and are rejected for the reasons given below.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1 and 3-5 are rejected under 35 U.S.C. 102(e) as being anticipated by Yamaura (JP 2002-075368).

As for claims 1 and 5, Yamaura teaches a positive electrode active material for a nonaqueous electrolyte cell wherein the particles of active material are of the formula $\text{LiNi}_{1-x}\text{M}_x\text{O}_2$ (and M is at least one of Al, B, Co), and the surfaces of the particles are covered by particles of the general formula LiFePO_4 (abstract, [0001]).

In paragraph [0037] of the instant disclosure, applicants name LiFePO_4 as a preferable positive active material. The examiner believes that this compound is

inherently of the olivine structure, since products of identical chemical composition cannot have mutually exclusive properties. MPEP 2112.02 (II)

Regarding claims 3 and 4, the $\text{LiNi}_{1-x}\text{M}_x\text{O}_2$ particles are 11.458 μm on average and the LiFePO_4 particles are 0.185 μm on average ([0054]).

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Yamaura in view of Negoro et al. (US Patent Number 6,156,459).

The teachings of Yamaura as discussed above are incorporated herein.

Yamaura fail to teach the claimed weight percent of LiFeO_4 to lithium nickelate substrate.

Negoro et al. teach that the conducting agent of the positive-active material of a secondary battery should be between 6 and 50 weight percent (3:49-54).

It is desirable to keep the amount of coating low in order to prevent deterioration of capacity.

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to use the weight percent guideline given by Negoro et

al. in the coating of Yamaura in order to prevent deterioration of capacity of the positive active electrode material.
